

# COVID-19 Gastrointestinal Endoscopy Guidance

**VERSION 2:** Reviewed and reissued 13<sup>th</sup> August 2020

Te Aho o Te Kahu (Cancer Control Agency) and Ministry of Health have worked with the New Zealand Society of Gastroenterology and clinicians to ensure a nationally consistent approach to endoscopy services during this challenging time. The priority is to support the continuity of services, whilst taking every effort to ensure safety of staff and patients and preventing the spread of COVID-19.

Gastrointestinal endoscopy (endoscopy) is a critical component of several health care pathways, including:

- Management of acute life-threatening emergencies e.g. gastrointestinal bleeding and infection
- Diagnosis and treatment of chronic diseases e.g. inflammatory bowel disease
- Cancer diagnosis, treatment and surveillance

## Ongoing of delivery of endoscopy services

Whilst the focus is on preserving the delivery of clinical care, we also need to be prepared for scenarios where delivery of care may be compromised. The guidance below supports a nationally consistent approach to changes in endoscopy. There must be a balance between risk of illness and spread of COVID-19 with the risk to patients and whānau of conditions not being diagnosed and treated optimally.

## Equitable delivery of care

Māori and Pacific peoples experience multiple and disproportionate barriers to accessing cancer diagnoses, treatment and care. Consequently, these population groups are frequently diagnosed and receive treatment at a relatively later stage and have worse cancer-related outcomes. The presence of pandemic conditions have been shown to dramatically accelerate systemic drivers of inequity including access to adequate income, shelter and food security. There is good evidence that standardisation of care across treatment pathways reduces inequities<sup>1</sup>.

We recognise that any limitation of services for patients based on survivability of their cancer will disproportionately impact Māori and other priority populations. DHBs should actively mitigate the impact of diagnostic and treatment decisions on inequity at all alert levels. This includes supporting Māori and other priority populations to have a prioritised, efficient, coordinated and streamlined diagnostic and treatment pathway. As capacity returns, DHBs should continue to strive for equity.

This guidance document fits into a wider framework of activity to mitigate the likely exacerbation of inequities in cancer care in the context of COVID-19. This includes the development of a monitoring framework to drive equity action during the pandemic.

## Treatment provision

The guidance on endoscopy provision considers:

- The balance between the risk of conditions not being diagnosed or treated optimally with the risk of illness and spread of COVID-19.
- The impact decisions will have on our most vulnerable patients, Māori and Pacific, and patients with comorbidities.
- This guidance does not preclude the need for clinical judgement and clinicians will need to be having clear discussion on the risks and benefits of endoscopy with their patients and whānau.

## Staff, patient and whānau safety

There are concerns regarding the possibility of transmission of COVID-19 between patients, whānau and healthcare staff. The Ministry of Health has provided national guidance around the use of personal protective equipment (PPE) in the context of COVID-19<sup>2</sup>. Infection prevention and control, including hand hygiene, working in teams and meticulous adherence to donning and doffing of PPE, is vital as part of a broad strategy to limit spread of the virus and protect staff, patients and whānau.

The New Zealand Society of Gastroenterology recognises endoscopies as aerosol generating procedures and have released recommendations around infection prevention and control and PPE for endoscopy staff in line with this<sup>3,4</sup>.

Safety also needs to be considered in the context of delayed or deferred treatment. Departments should consider the following:

- Have robust processes for managing wait lists to ensure patient safety is maintained. There must be timely and clear communication with patients/whānau and primary care, including a point of contact for patients and their whānau.
- Departments must have a process for reviewing wait lists to identify those whose clinical situation is becoming more urgent.
- A transparent process for auditing referrals that have been declined and sent back to GP (will be reviewed by ethnicity).
- Establish options to increase capacity to manage any backlog and anticipated surge. This may include maximising existing human and theatre resources within DHBs.
- There is recognition that in smaller regions endoscopy procedures may be provided by one or two individuals, making these regions less resilient in the event of staff illness or isolation requirements. Similarly, new ways of working will likely impact on through-put capacity. DHBs should consider options to use other sites within their network or activate regional links to improve regional equity. The New Zealand Society of Gastroenterology (NZSG) is available to support local services to create networks to smooth patient flow around a region and/or advertising requests for temporary redeployment of specialists to areas of need.

# Collaborative approach

## System planning around cancer care

Endoscopy is a critical cancer diagnostic and therapeutic service. This guidance is part of whole system planning for cancer care, aligning with cancer surgery, cancer imaging, medical oncology, radiation oncology and haematology guidance. The aim is to support the whole of the cancer care pathway to be operating at a consistent level at different hospital capacities.

## Multidisciplinary meetings

Multidisciplinary meetings should continue, noting that the form of meetings may change, e.g. virtual conferences. Clinical teams may face difficult decisions and if resources are constrained, care may deviate from usual pathways. Many of these pathways were already contributing to inequities. It is recognised that in times of stress biases may be exacerbated, which may impact decision making and increase inequities. These issues should be acknowledged within multidisciplinary meetings. Where a Māori or Pacific patient's care does not follow the usual treatment pathway, the MDM should consider what can be done to maximise the potential for Māori or Pacific health gain and equity.

# Endoscopy service activity levels

The COVID-19 situation is likely to be ongoing for some time, and as such planning must take a long-term approach. The National Hospital Response (NHR) Framework uses colour-coded alert levels to clearly communicate when a whole-of-hospital adjustment to services is required because of an escalation of the COVID-19 situation. Different DHBs may be at different alert levels on the NHR Framework and hospitals can move up or down the alert levels, as needed. **Note:** DHB alert levels are distinct from the Government alert levels (1-4).

<b>Green Alert</b>	Preparation
<b>Yellow Alert</b>	Maintain Service Activity Levels 1, 2, 3 and, if possible 4
<b>Orange Alert</b>	Maintain Service Activity Levels 1 and 2 and, if possible, 3
<b>Red Alert</b>	Maintain Service Activity Levels 1 and, if possible, 2*

*\*SMO decision making on a case-by-case basis*

Service Activity Levels for endoscopy services have been set using the pre-existing endoscopy priority guidance categories Urgent (P1), Semi urgent (P2), Surveillance (P3).

Māori and other vulnerable patients, who are likely to have experienced systematic barriers and delays in care, should be supported to complete endoscopy and prioritised through the pathway.

## Service Activity Level 1

- Emergency endoscopy
- Examples include: severe upper GI bleeding, acute oesophageal obstruction, acute cholangitis, urgent nutritional support (PEG/NJ/NG)

## Service Activity Level 2

- Symptomatic P1: urgent, within 2 weeks
- Examples include: urgent 'likely cancer' referrals, new suspected IBD, cancer staging EUS (biopsy and/or staging)
- Prioritise Māori and Pacific patients from level 3 to help overcome systematic delays in accessing care

### Service Activity Level 3

- National Bowel Cancer Screening Programme faecal immunohistochemical test (FIT) positive colonoscopy (aim to maintain at orange alert level)
- P2 B1 (Prioritised) endoscopy: semi-urgent, within 6 weeks, higher priority for more urgent clinical need
- Advanced endoscopy if benefit > risk and if capacity for managing complications

### Service Activity Level 4

- P2 B2 endoscopy: semi-urgent, within 6 weeks, standard
- P3 1Y Surveillance (e.g. hereditary nonpolyposis colorectal cancer)
- Advanced endoscopy

### Service Activity Level 5

- P3 5Y surveillance
